

Introduction to Visual Basic .NET

Instructor Name: Assist.Lec. Aseel F. Alshaibanee

Département: Computer Science

Level: Two

What is VB.NET?

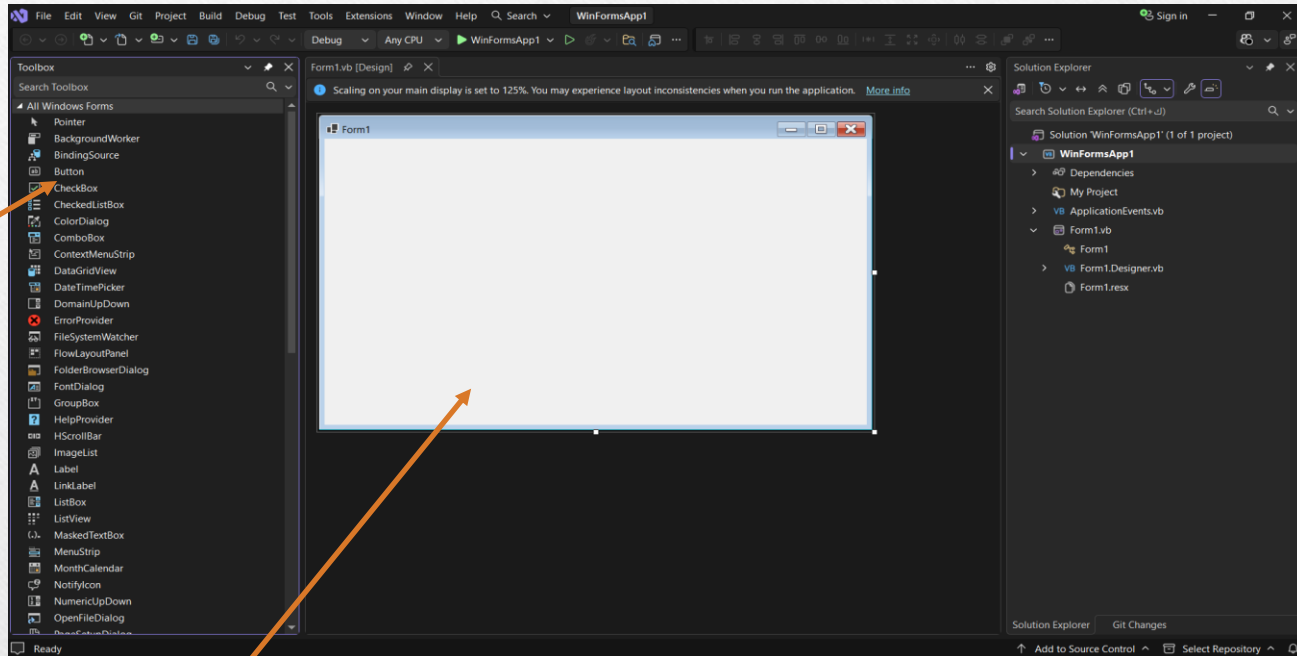

- Developed by Microsoft
- Part of the .NET platform
- Used to build Windows applications
- Supports Object-Oriented Programming (OOP)

How to Install Visual Studio

- 1- Visit the official Microsoft website
- 2- Download Visual Studio Community (Free)
- 3- Run the installer
- 4- Select .NET Desktop Development
- 5- Complete installation

Visual Studio Interface

2- Toolbox

1- Form (Window)

Visual Studio Interface

1. Form

- A **Form** in VB.NET is basically a **window** that appears on the screen in your application.
- It acts as a **container** for all the **controls** (buttons, textboxes, labels, etc.) that the user interacts with.
- Every VB.NET program that has a graphical interface starts with at least **one form** (usually called Form1).
- Think of a Form as the **canvas of your program's interface**. Everything the user sees and interacts with is placed on forms.

Visual Studio Interface

- **Forms Are Classes** in VB.NET, a Form is actually a **class**
- **Example:**
`Public Class Form1`

`End Class`
- Form1 is the name of your form.
- You can create multiple forms for different windows in your app.

Visual Studio Interface

Form Properties

Every form has properties that control its appearance and behavior:

Property

Text

Size / Width / Height

BackColor

StartPosition

FormBorderStyle

TopMost

Purpose

The title that appears on the window.

Dimensions of the form.

Background color.

Where the form appears on the screen.

The type of border (sizable, fixed, none).

Keeps the form always on top of other windows.

Visual Studio Interface

2. Toolbox

- The **Toolbox** is a **panel in the Visual Studio IDE** that contains all the **controls and components** you can add to your forms.
- Think of it as a **toolkit** for building your program's interface.
- You **drag and drop** items from the Toolbox onto your form to create buttons, textboxes, labels, etc.

Where to Find It

- In **Visual Studio**, the Toolbox is usually on the **left side** of the window.
- If you don't see it: go to **View → Toolbox** or press **Ctrl + Alt + X**

Visual Studio Interface

- **Using the Toolbox**
 1. Select a **control** in the Toolbox.
 2. Drag it onto your **form**.
 3. **Resize and position** it using the mouse.
 4. Set **properties** in the Properties window.
 5. Add **event handlers** (like click events) in your code.
- Example:
 1. Drag a **Button** from the Toolbox to Form1.
 2. Change its **Text property** to “Click Me”.
 3. Double-click the button to add a Click event in the code:

Visual Studio Interface

- **Summary**

- **Toolbox = Your toolkit** in Visual Studio for building interfaces.
- Contains **controls and components** you can drag to your forms.
- Makes creating a **GUI fast and visual** without writing all the layout code manually.

Visual Studio Interface

- Simple code to show message when click a button.

```
Public Class Form1
```

```
    Private Sub Button1_Click(sender As Object, e As EventArgs)  
Handles Button1.Click
```

```
        MessageBox.Show("Button clicked!")
```

```
    End Sub
```

```
End Class
```

Simple Example

- Create a form and add two textbox , label and button then write a code to add the values of the two textbox and show it in the label when pressing the button as shown in the next slide.

Simple Example

A screenshot of a simple Windows application window titled "Form1". The window has a light blue background and a standard Windows title bar with minimize, maximize, and close buttons. Inside the window, there are two white rectangular input fields at the top. Below them, centered, is the Arabic text "النتيجة" (The result). At the bottom center, there is a light blue button with the Arabic text "اضغط" (Click).

Simple Example

- Solution

```
Public Class Form1
    0 references
    Private Sub Button1_Click(sender As Object, e As EventArgs) Handles Button1.Click
        MessageBox.Show("Button clicked!")
        Label1.Text = Val(TextBox1.Text) + Val(TextBox2.Text)
    End Sub
End Class
```

Thank You
